NAUE-Fixing Armature for Hoses

The most safe and aseptic manner to equip a flexible hose, e. g. a flexible silicone hose, with connecting armatures, is to press the armature using a pressing bush.

Clamping jaws: To be used for hoses of chemical and dairy industry

The solution often used as alternative and auxiliary solution i. e. to put a hose on a nozzle and to fix it with hose clamps, is not compatible with a production to be conform to FDA-regulations.

Regarding this problem, the NAUE- fixing armature for hoses represents an efficient solution, because due to its rigidity and the absence of splits, it is very close to pressing.

The NAUE-fixing armatures for hoses are hose connections which can be detached and reused, suitable for silicone hoses of different construction, even able to compensate tolerances of 2 mm of the outer diameter.

Due to its easy assembly, safe handling is guaranteed.

Available in all current dimensions, the fixing armature can be equipped with all technical practicable connections e. g. sanitary fittings, tri-clamps, fittings according to DIN 11851, connecting pieces etc.

-
- NAUE - leader in aseptic and heat technology
 - Completely proprietary development
 - The only company with complete aseptic product range
 - NAUE-aseptic technology – more than 20 years in use without any improvement due to its well-elaborated construction
 - NAUE-aseptic and heat technology – always the number one in this branch!
